Information

AroundMe Report is our company's offer with the aim of helping you to be aware of what surrounds your store. This information is from vital importance for your decisions.

Data sources for this report example

ISTAT: census 2011

MEF: income 2016

Calculation notes

Starting from the data sources, the information was elaborated with advanced techniques geographical positioning them on the territory with the proprietary Building Link methodology where the data are positioned based on the presence of residential buildings on the cartography, this method provides a higher quality of data than the usual techniques of uniform distribution of data on the territory. The fundamental contribution of isochrones (travel time maps) allows us to provide you with a high-level analysis.

Other notes

The report analyzes and compares two points of sale **A** and **B**. Based on different catchment areas, calculated starting from the reachability on foot by bicycle and by car, estimates of population and income are provided. In the event that the reachability areas of the two stores overlap and therefore there is a sharing (**C**) of the catchment area, the calculations of the population and income indicators are performed also for the shared area.

Income notes

The income values are expressed with the following measures:

€ euros

K€ thousands of euros

M€ million euros

B€ billion euros

Custom report

The travel time values are examples, you can request reports with customized times. The population and income data depend on availability for the country where the stores are located.

It is also possible to use walking distances in meters. Isodistances instead of isochrones. The data available are those indicated in the report, but it is possible to add other indicators if referable to the population and available in public archives at the municipal level or more detailed.
